

ABSTRACT OF THE DISCLOSURE

An improved locker is provided. The locker includes a ventilation system that draws air into and out of the locker to facilitate drying articles in the locker. An electronic control system in the locker permits a user to transmit and receive messages to and from a remote source, and, to access the Internet. The locker door slides along tracks when opened and closed to minimize the risk of damage to the door. Backlighting and positioning of counter top surfaces in the locker make the locker ergonomically friendly.
